Brighten up your skin

Dark spots, or benign pigmented lesions, such as freckles, liver spots, and café au lait spots, appear in many people and on different areas of the skin. Some spots are related to excessive sun exposure.² Others, can be caused by hormone changes, often impacting many women following pregnancy.³ Many of these skin discolorations can be distressing and affect quality of life.¹

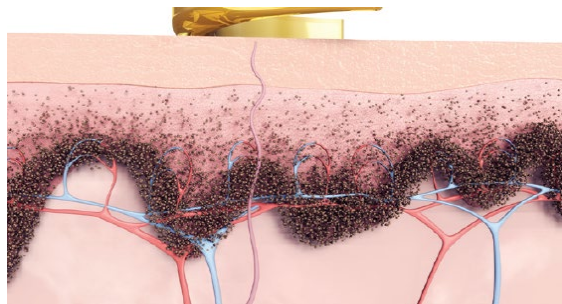

Why PicoWay® treatments?

- Clearance in fewer treatments
- Better results
- Less discomfort

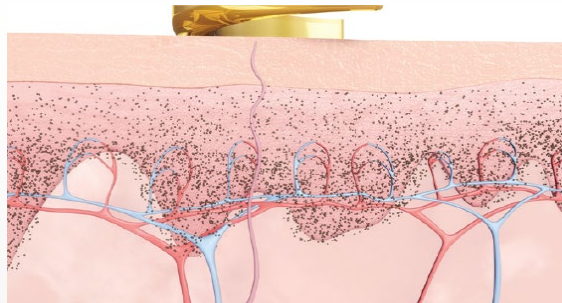

PicoWay® reduces pigmentations with advanced technology

Laser light is targeted at unwanted pigment in ultrashort picosecond pulses. These pulses shatter the pigment into very tiny particles which are then easily eliminated by the body's natural processes. The PicoWay® laser emits less heat energy than traditional lasers providing a more comfortable treatment with fewer side effects.

a. Pigmentation before Picoway® treatment

b. PicoWay® technology shatters the pigment into miniscule particles that can easily be removed by the body.

Treatment is low to no downtime.^{4,7}

In clinical studies, the most common immediate side effects were redness, mild swelling and temporary darkening of the treatment sites.^{6,7} Check with your healthcare provider to discuss your treatment goals, and understanding pre- or post-treatment care.

PicoWay® quickly clears problematic skin discolorations

- ✓ Well tolerated and suitable across a range of skin types⁷
- ✓ Treatment results could depend on many factors such as location, depth, size and type of pigmentation.
